Gas Reservoir Engineering

Reservoir engineering is a branch of petroleum engineering that applies scientific principles to the fluid flow through porous medium during the development and production of oil and gas reservoirs so as to obtain a high economic recovery. The working tools of the reservoir engineer are subsurface geology, applied mathematics, and the basic laws of physics and chemistry governing the behavior of liquid and vapor phases of crude oil, natural gas, and water in reservoir rock.

Reservoir engineering - Wikipedia

Gas reservoir production performance forecast is the core task of gas field development management throughout the lifecycle of gas field development. In the beginning stages of the development of the gas field, the material balance method and the numerical simulation method were the main methods for performance forecast.
